

Shrink Wrap Pro™

Shrink wrap for temporary roofs and weather protection

Shrink wrap is an ideal material for creating ‘drum tight’ sheeting of scaffolding around buildings or structures. The shrink film is tough, fire retardant, has UV inhibitors and anti-brittle agents.

Shrink wrap has many advantages over traditional cladding methods:

- Independent of the type of scaffolding
- Better weather protection
- Less likely to detach, therefore much less callouts
- Tear resistant and easily repairable
- Can provide 100% encapsulation
- Moulds around irregular shapes

Shrink Wrap Pro™ provides an on-site shrink wrapping service to scaffolding companies, builders and self-builds. Shrink Wrap Pro™ also sells shrink wrap supplies and equipment and provides training in shrink wrapping to companies.

Contact **Shrink Wrap Pro™** to discuss your requirements. On-site demonstrations can be arranged.
